1. Login Form Validation — JavaScript

Create a login form with:

- Email
- Password
- Login button

Using JavaScript:

- Email should not be empty.
- Password should contain at least 8 characters.
- If any validation fails, display an error message.
- If everything is valid, display "Login Successful".
- Do not refresh the page when submitting the form.

Focus: DOM manipulation, events, conditions, form validation.

2. Dynamic Background Changer — JavaScript + CSS

Create a webpage with **four buttons**:

Red Blue Green Yellow

When the user clicks a button, change the webpage's background color accordingly.

Additional requirements:

- Display the selected color name on the page.
- The selected button should have a different visual style.
- Use JavaScript to modify the CSS dynamically.

Focus: Events, DOM manipulation, classList, CSS classes.

3. Student Result Table — CSS + JavaScript

Create a webpage containing a table with **5 students**.

Columns:

Name | Mark 1 | Mark 2 | Mark 3 | Total | Average | Result

Using JavaScript:

- Calculate Total.
- Calculate Average.
- If average ≥ 40 → Pass
- Otherwise → Fail.
- Display the calculated values dynamically.
- Add a button called **"Calculate Result"**.

Using CSS:

- Style the table.
- Add alternate row colors.
- Highlight the Pass and Fail results differently.
- Add hover effect to table rows.
- Make the table responsive.

Focus: DOM manipulation, loops, conditions, functions, table styling, responsive CSS.
